

MATE · SEED 2026

Text a local number. *Pay the whole world.*

Every country gets its own Mate number. iMessage, Android and WhatsApp users can send money to any number on earth, any international area code, all inside the thread. No app required to get started.

THE GAP

Messaging is the world's largest *unbanked network*.

Billions already talk in Messages, with no way to send, earn, or grow money without leaving the app. Stablecoins made the money itself instant and nearly free, and Base already hosts 25+ local currency coins. The rail is finished. The front door isn't. That gap is the opportunity.

2.2B+

active Apple devices, plus every Android and WhatsApp thread

\$857B

sent across borders every year, past \$900B in 2026

6.36%

average fee to send money home. 14.99% through a bank

ACCESS

A coin with no corridor is just *a local currency again.*

Coinbase and Base are putting the whole financial system onchain, every currency, every asset, open to anyone. Being onchain isn't the same as being reachable. Access is the missing half, and messaging is where every family and every friend already is.

01 Every currency is going onchain

Base hosts 25+ local stablecoins across 21 currencies today, and is targeting every global currency by 2027.

02 Onchain is not the same as reachable

A rupiah coin sitting in a contract is invisible to the sender in California and useless to the family in Jakarta.

03 Access means any coin, any country

Send money home, pay a friend, get paid for work, without knowing which chain, which coin, or which app.

04 Messaging is where everyone already is

Every family, every friend, already in a thread. No install, no address book to rebuild. That's why we build there.

THE PRODUCT

A local number. *A* *global account.*

The number is local so funding, cash-out and support work in your market. The account behind it is global, one thread that reaches any phone number in the world. The Mate app comes later, for advanced sends; the thread is enough to start.

01 Text your country's number

That first message is the signup. We create the wallet for you, abstracted behind your email, no seed phrase, no app required.

02 Send to any number, anywhere

Not just your corridor. Any phone number on earth, whether or not they've ever heard of Mate.

03 Receive the same way

Money in and money out both arrive as a text into your Mate Account. One thread is the whole interface.

04 It lands in local money

USDC in, IDR out, auto-converted on arrival, cashed out by the licensed ramp in that market.

THE NETWORK

Each country is a node. The agent is *the wire between them*.

COUNTRY NODES · NUMBERS WE PROVISION

United States	USDC
Indonesia	IDRX
Singapore	XSGD
Philippines	PHPC
Japan	JPYC

MATE · THE NETWORK LAYER

Number layer

In-country numbers via Photon. One per market, on iMessage, RCS and WhatsApp.

Account layer

One Mate Account per phone number. Sends and receives land as text, in the same thread.

Routing layer

Settlement and auto-swap on Base. The licensed ramp in each market does the regulated leg.

REACH · ALREADY INSTALLED

iMessage Live · via Photon
RCS · Android Live
WhatsApp Next market
Any number on earth The recipient installs nothing. A text arrives with the money in it.

THE POSITION

Neutral *by* *design.*

We don't issue, we don't hold licences and we don't pick a winner. Any issuer can join the network, which is exactly why every issuer can.

01 One integration, every market

An issuer connects once and reaches every country node on the network.

02 Their licences, not ours

The issuer and the in-market ramp are the regulated parties of record. We move messages and route intent.

03 Every node makes the next one worth more

Node five is worth more than node one to every issuer already connected. Classic network compounding.

04 Corridor-first, aggregator by design

We open APAC corridors ourselves to prove the rail, and every issuer joins the same network behind it.

CORRIDORS

Five nodes. *APAC first.*

The US node is live. Asia comes online next, five markets is the minimum Photon needs to provision international numbers, and APAC is where the local stablecoins, the ramps and the remittance volume already are.

LIVE

United States

USDC

Sending side. Apple Pay and card funding today.

WEDGE

Indonesia

IDRX

Rupiah stablecoin on Base. Large inbound remittance base.

WEDGE

Singapore

XSGD

Regulated hub. Outbound sender market for the region.

PROPOSED

Philippines

PHPC

One of the densest remittance corridors in the world.

PROPOSED

Japan

JPYC

Licensed yen stablecoin. High iMessage penetration.

BUSINESS MODEL

The swap *and the float.*

Two lines, both tied to volume rather than headcount. Every send converts, and every balance sits somewhere. Pre-revenue today. The first paying nodes land with the seed.

SENDING \$200 A worked example	Incumbent, all-in \$12.72 · 6.36% global average	Mate conversion leg \$0.84 · 0.42% swap	Plus the ramp's own fee Set in-market by the licensed partner, not by us.
--	--	---	--

CONVERSION

0.42%

On every auto-conversion into the local stablecoin (USDC → IDRX, USDC → MXNB). Scales directly with corridor volume.

YIELD

3 potential sources

A cut of user yield on idle balances, issuer reserve-yield shared for distribution, and local issuers paying to be held.

WHY NOW

Three things *just aligned.*

The rules are still being argued, the volume already arrived, and incumbents started paying billions for stablecoin distribution. It's happening either way.

01 The rules are written

The GENIUS Act gave the US a federal stablecoin framework in July 2025; MiCA is fully applicable in the EU. Local issuers now launch under real law.

02 The volume is real

\$390B of end-user stablecoin payments in 2025, more than double the year before. This is no longer a thesis.

03 Distribution is what gets bought

Mastercard agreed to acquire BVNK for \$1.8B in March 2026. The scarce thing in this market has a price, and it isn't issuance.

TRACTION

The rail is *already carrying traffic*.

The US node is live on iMessage and RCS, with a signed issuer MoU and an on/off-ramp integrated. These numbers prove delivery and behaviour, the network is what we're selling.

PARTNERS

We rent nothing *that matters twice.*

Photon carries the numbers, Definitive carries the swaps, Base carries settlement, and licensed ramps carry the regulated leg. We own the account layer and the network between the nodes.

 Photon

Photon

LIVE · NUMBER INVENTORY

iMessage and RCS delivery, and in-country numbers at five markets.

Definitive

LIVE · SWAPS

Powers every in-thread swap and the auto-conversion into local stablecoins.

Base

LIVE · SETTLEMENT

Every send, receive and swap settles on Base.

IDRX

FIRST LOCAL NODE

Indonesia. The rupiah stablecoin on Base, our first market outside the US.

Built by people who *live in the chat.*

FOUNDER & CEO

Matthew Meakin

Former private interventionist to high-profile clients, trust was the whole job, with no handoff when it mattered. Built the Base Event Agents, deployed at Basecamp 2025 and DevConnect. Base Batches 002.

CO-FOUNDER & CTO

Risavdeb Petra

Full-stack engineer deep in Base since early, frontend, backend, cloud infrastructure, and onchain integrations. Builds AI-powered consumer applications.

CO-FOUNDER & ENGINEER

Aritra Roy

Backend and systems engineer building scalable, real-world software.

CO-FOUNDER & CBO

Michael Gale

Two startups built and exited. Onchain full-time since 2021, launched Junkyard Dogs, sold out in under eight minutes, now a recognized Sandbox partner with five experiences in development.
